

Every row.
Every scroll.
Every time.

Your LazyColumn redraws
every visible row whenever
anything changes.

There is usually one reason,
and you handed it over
yourself.

It redraws the room every time you blink

0.3s crossfade

THE RECOMPOSER

exhibit 05

@Composable

A gremlin that repaints the house when you were not looking, and does not mind an empty room. Feed it an unstable List and it repaints everything.

The Loopdown

@darkpandawarrior

02 / 05

swipe

// THE CAUSE

A List is not a stable type

```
// before: List is unstable, rows cannot skip  
@Composable fun Feed(items: List<Post>) { ... }
```

```
// after: an immutable list is stable, skipping works  
@Composable fun Feed(items: ImmutableList<Post>) { ... }
```

Let it prove nothing changed

01 Hand it an ImmutableList
`kotlinx.collections.immutable`, not `List`

02 Or mark the holder @Immutable
when you can promise it never mutates

03 Give items a stable key
`items(list, key = { it.id })`

04 Measure, do not guess
turn on recomposition counts and scroll

Compose is fast. You handed it a puzzle

It can skip anything it can prove did not change.
Stability is that proof.

Most "Compose is janky" is really "I gave it
something it could not reason about".
