

// SENSORS WHO LIE

We filtered bad data. Then lost it.

Months later someone asked
if the filter was working.
I could not answer.
The evidence was gone.

// THE TRAP

return
destroys
the proof

if (!plausible) return

Clean data comes out.

Feels responsible.

You just deleted your only

// THE DELETE LIST

**Two
things.
That's all.**

Coordinates out of range.

Accuracy under 0.1m or
over 250m.

Physically impossible.

Nothing else is ever dropped.

// INSTEAD: BUCKETS

Label it, don't lose it

original: everything we saw

mock: fake provider

abnormal: failed the check

spike: teleports over 5km

cleaned: what we trust

// PROVENANCE

The row keeps its papers

accuracy, provider, bearing,
altitude, gyro + accelerometer,
battery, device model,
isMock, isAbnormal.
Not just a coordinate.

// WHAT IT BOUGHT

A filter you can argue with

Disputes: show what came out.

Thresholds: replay and count.

Twice the data said we were
wrong. We moved the line.

Impossible if you delete.

// THE RULE

Where do your rows go?

Fraud scoring, metrics, logs,
feature stores. Same shape.
Filtered means not counted,
and here is why.
