

// CHAIN OF CUSTODY

We were right. And still wrong.

Our algorithm said the driver
did 4km less than they thought.
It was probably correct.
Shipping it silently would
still have been wrong. Swipe.

The number becomes money

Mileage ends in an expense
claim.

Filtering stopped being a
technical decision the moment
the output paid somebody.

// THEIR VIEW

40km.
App says
36.

They cannot tell a careful
algorithm from an employer
shaving expenses.
Both look the same:
a smaller number, no reason.

// FIX 01

Show the original

Both numbers exist in the
data model, so show both.

We measured 40 and propose 36,
not 36 as if it were all
that ever happened.

// FIX 02

Name what you removed

Not 'adjusted for accuracy'.

Abnormal. Mock. Spike.

Categories are checkable.

Vagueness is not.

// FIX 03

Let them overrule you

A toggle for whether abnormal
is subtracted.

They were there. You weren't.
And if your threshold is wrong,
this is the cheapest feedback.

// THE RULE

Earn it, don't ask for it

Money, time, reputation:
correctness is table stakes,
transparency is the product.
Being right in silence is just
asking to be trusted.
