

// ONE BRAIN, TWO BODIES

expect/actual is the wrong default

Every KMP tutorial teaches it first.

Then people use it for everything and the shared code becomes a knot. Swipe.

// WHAT IT IS

A weld, not a wire

expect/actual binds common to
one platform impl by name,
at compile time.

One actual per platform.

The compiler picks it.

// WHERE IT HURTS

You can't fake it

No test actual, so common
code can't be unit tested.

No second implementation.

No injected fake.

Welded to the platform.

// THE BETTER DEFAULT

Interface in common, injected

```
interface Clipboard {  
    fun copy(text: String) }  
Real impl per platform,  
handed in via DI.  
Fake it in one line.
```

// WHEN IT IS RIGHT

Small, fixed joints

A typealias to a platform type.

A single declaration with one
meaning per platform and
nothing to test.

The genuine permanent weld.

// THE TAKEAWAY

Keep your options open

Interfaces and injection
compose and test.
expect/actual welds.
Weld only where you want
one permanent joint.
