

// SENSORS WHO LIE

Your GPS is lying to you

Our app once clocked a
parked car at 400 kmph.
The phone was completely sure.

Swipe for why, and the fix.

A witness with a concussion

GPS looks like truth.
It behaves like a witness
who took a hit to the head.
Confident. Cooperative.
Often flat wrong.

// WHY IT HAPPENS

Tunnels, towers, garages

In a tunnel it repeats the last spot for ~40s, then jumps to catch up.

Big jump over tiny time is your 400 kmph.

// FIX 01

Catch the liars

If a reading needs rocket
acceleration, it is fake.

Give physics a veto.

Drop the point before it
touches your data.

// FIX 02

Dead reckoning

When GPS goes dark,
estimate from motion sensors
and your last good heading.
Like a sailor with no stars.
It bridges the gap.

// FIX 03

Fuse, don't pick

Weight every signal by
how much you trust it now.
Clean GPS pulls hard.
Jittery GPS gets outvoted.
Nobody gets a veto.

// THE TAKEAWAY

Assume inputs will lie

Good systems don't need perfect inputs. They plan for the day inputs lie.

Follow for more field notes.
