

Nobody is looking at this screen.

It is still collecting. Still
emitting. Still burning
battery, for a user who
switched apps ten minutes
ago.

One word fixes it.

It does not mind an empty room

0.3s crossfade

THE RECOMPOSER

exhibit 05

@Composable

Backgrounding the app does not leave the composition. So the collection keeps running, the flow keeps emitting, and the ViewModel keeps working for nobody.

The Loopdown

02 / 05

swipe

// THE ONE WORD

collectAsState WithLifecycle

```
val state by viewModel.data.collectAsStateWithLifecycle()
```

The Loopdown

@darkpandawarrior

03 / 05

swipe

Make lifecycle the default

01 Default to WithLifecycle
`androidx.lifecycle.compose`, stops below `STARTED`

02 Plain collectAsState is the exception
and it needs a reason in the review

03 Know what it costs
an off-screen flow still pays for every emission

04 Check with the app backgrounded
the leak is invisible from the foreground

Lifecycle is not a thing you bolt on later

It is the difference between work that stops when the user leaves and work that quietly runs forever.

Default to the one that respects it.
