

Filtered should never mean deleted

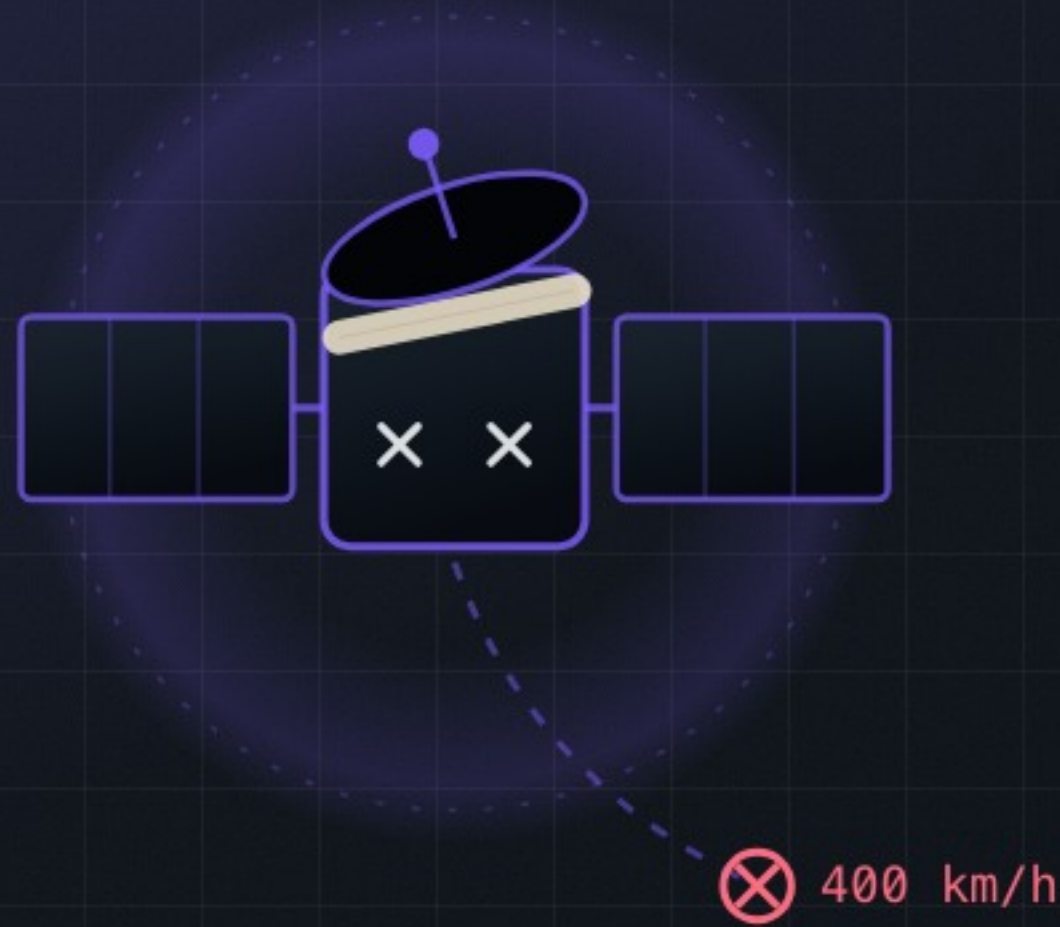

We shipped a filter that
threw away bad GPS.
Months later someone
asked whether it was
working.

I could not answer. The
evidence was gone.

// THE CAST

We threw away its testimony

THE CONCUSSED WITNESS

exhibit 01

LocationManager

Dropping a bad reading destroys the only evidence that could have told you whether dropping it was correct.

The Loopdown

@darkpandawarrior

02 / 05

swipe

Classify. Do not discard.

Dropping a bad reading destroys the only evidence that could have told you whether dropping it was correct.

Keep the rejects

01 Persist everything
the raw row lands before any judgement

02 Classify into named buckets
not a boolean, a reason

03 The trusted number is a view
a query over the data, not the only survivor

04 The buckets are the instrument
they are how you tune the filter later

You cannot tune a filter you cannot audit

And you cannot audit what you deleted.

If your pipeline drops rows, know where they go.

"Nowhere" is an answer, just not a good one.
