

We were right.
We were
still wrong.

Our algorithm decided a driver had travelled 4km less than they thought. It was probably correct.

Shipping that silently would still have been wrong.

4km

THE ARCHIVIST

exhibit 03

Provenance

The moment your output becomes somebody's reimbursement, correctness stops being enough. We were about to win the argument and lose the user.

The Loopdown

@darkpandawarrior

02 / 05

swipe

// EXPLICIT DEGRADATION

Report the delta, not just the answer

```
var final = smartAnalysis.originalDistance  
if (removeAbnormal) final -= smartAnalysis.abnormalDistance
```

Four things, every time

01 The original

what we measured before we touched it

02 The delta

exactly what we removed, in their units

03 The reason

in their language, not your enum name

04 The right to push back

an appeal path, even a slow one

Correctness is table stakes. Transparency ships.

When your output becomes an input to somebody's money, time or reputation, the working IS the product.

Show the original, show the delta, show the reason, and let them argue.
