

Five numbers. They did not add up.

They were supposed to.
Nothing in the codebase
checked that they did, and
for a while they quietly did
not.

The assertion is one line.

THE ARCHIVIST

exhibit 03

Provenance

A relationship your code assumes but never states is a bug waiting for a refactor. The Archivist writes it down so a future stranger cannot quietly break it.

The Loopdown

02 / 05

swipe

Make the rule executable

A relationship your code assumes but never states is a bug waiting for a refactor. The Archivist writes it down so a future stranger cannot quietly break it.

Errors and warnings

- 01 Components sum to the total**
error. this must never be false.
- 02 A subset never exceeds its parent**
error. structural, not stylistic.
- 03 Two measurements stay in range**
warning. suspicious, not impossible.
- 04 Run it before it leaves the device**
cheapest place to catch corruption

Invariants are cheap. Silent corruption is not.

Find the relationships your code already assumes and make them run.

One line now, or a support queue later.
